

Implement Client Script & UI Policy (Incident)

6. Project Documentation

ServiceNow Incident Management

Detailed Phase Report

6. Project Documentation

6.1 Introduction

Project Documentation records what was implemented, why it was implemented, how it was tested and what result was obtained. Good documentation makes the project easier to understand, verify and present.

6.2 Configuration Documentation

For the Client Script, document the name, table, type, field, UI type, active state, condition and script logic. For the UI Policy, document the name, table, condition, active state and every UI Policy Action.

6.3 Test Case Documentation

TC01 – Initial Form: Open a new Incident. Expected result: normal form behavior.

TC02 – Trigger: Enter/change the configured value. Expected result: Client Script behavior occurs.

TC03 – UI Policy: Satisfy the UI Policy condition. Expected result: configured field action is applied.

TC04 – Reverse Condition: Change the value so the condition is false. Expected result: field returns to its intended normal state.

TC05 – Valid Submission: Provide all required information and submit. Expected result: Incident is saved.

TC06 – Missing Required Data: Leave a required field empty. Expected result: form prevents incomplete submission.

6.4 Screenshot Documentation

Recommended screenshots include:

1. Client Script list/form.
2. Client Script configuration fields.
3. Client Script code or condition.
4. UI Policy configuration.
5. UI Policy Action configuration.
6. Incident form before the condition.
7. Incident form after the condition.
8. Successful test result.

6.5 Screenshot Captions

Each screenshot should have a short caption such as “Figure 1: Client Script configuration for Incident table” or “Figure 2: UI Policy Action making the Description field mandatory.” Captions help the evaluator understand the evidence.

6.6 Result Documentation

The final result should state whether the Client Script and UI Policy behaved as expected. Any issue found during testing should be corrected before the final demonstration. The final document should contain the configuration, test cases, screenshots and conclusion.

6.7 Conclusion

Documentation provides evidence that the project was not only configured but also tested. It acts as a permanent record of the implementation and result.
