

Implement Client Script & UI Policy (Incident)

7. Project Demonstration

ServiceNow Incident Management

Detailed Phase Report

7. Project Demonstration

7.1 Introduction

The Project Demonstration presents the completed ServiceNow project to the evaluator. The demonstration should be short, clear and focused on the problem, configuration and final result.

7.2 Demonstration Preparation

Before the demonstration, verify that the ServiceNow instance is accessible, the Client Script is active, the UI Policy is active, the required fields and conditions are correct and the test data is ready. Keep the configuration pages and Incident form ready to show.

7.3 Demonstration Flow

Step 1: Introduce the project title.

Step 2: Explain the problem with static or inconsistent Incident form entry.

Step 3: Open the Incident form.

Step 4: Show the Client Script configuration.

Step 5: Explain the Client Script event and logic.

Step 6: Show the UI Policy and its condition.

Step 7: Show the UI Policy Actions.

Step 8: Return to the Incident form.

Step 9: Perform the triggering action.

Step 10: Show the resulting field behavior.

Step 11: Test the non-triggering condition.

Step 12: Submit a valid Incident and show the result.

7.4 Expected Demonstration Result

The evaluator should be able to see that the Incident form responds dynamically. The configured Client Script should execute at the correct event, and the UI Policy should change the configured field state when its condition is satisfied.

7.5 Questions and Answers

What is a Client Script? A client-side script used to control form behavior in ServiceNow.

What is a UI Policy? A configuration that dynamically controls field properties based on a condition.

What are UI Policy Actions? Actions that control field properties such as mandatory, visible and read-only.

Why use UI Policy? It can handle simple field-state requirements without unnecessary JavaScript.

Why use Client Script? It is useful when programmable client-side logic is required.

7.6 Final Result

The completed project demonstrates dynamic behavior on the ServiceNow Incident form using Client Script and UI Policy. The configuration helps guide users and maintain consistent data entry while keeping the Incident form practical to use.

7.7 Conclusion

The Project Demonstration completes the project lifecycle from idea to implementation. By explaining the requirement, showing the configuration, performing the test and presenting the final result, the project can be clearly evaluated.
